

Cardio Training Template

Client Name:	Bob
Outcome Goal:	Bob enjoyed his 10K fun run so much that running has become his new hobby. He joined a running club, has been working with a coach, and has been entering one or two races a month, either 5K or 10K, for the past year. This racing season, which runs from May through October, his goal is to finish in the top 10 of his age group at the local half-marathon, which completes the local running season at the end of October.
Process Goals:	Base: He will do two long runs at a steady state to improve aerobic endurance, one workout of high-intensity sprinting to improve speed and anaerobic conditioning, and one outdoor cycling ride for cross-training and aerobic endurance. Build: He will do three long runs at a steady state to increase aerobic endurance, one short run at a slower tempo for recovery, one sprint workout for speed and anaerobic conditioning, and one outdoor bike ride for cross-training. Taper: He will do three runs of decreasing distances and a slower-than-race tempo to prepare for the race. Recover: He will do lower-intensity exercises at shorter distances to unload the body, reduce stress, and promote recovery; one long walk, one run at a slow pace, and one outdoor bike ride.
Assessment Considerations:	Bob has an office job where he spends most of the day seated at a desk. He performs daily flexibility exercises using a foam roll and static stretching to support his running programs but still demonstrated a lower-extremity postural distortion because his knees were adducted during the overhead squat assessment, so he might have tight calves and adductors.

Annual Plan

MONTH	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase					Base			Build		Taper	Recover	

Base Phase

He will perform self-myofascial release using a foam roller prior to the start of each running workout: for calves, peroneals, hamstrings, quadriceps, adductors, piriformis, and hip flexors for 30 to 45 seconds for each muscle group, both right and left. He will perform dynamic flexibility with agility drills of high knees, skips, lateral shuffles, Cariocas, and backpedals prior to the start of the sprint workout. He will start outdoor cycling at a slow pace and gradually increase the speed during the first 8 to 10 minutes of the ride.
