

Cardio Training Template

Client Name:	Bob
	Bob is looking to do his first 10K fun run in October. He is an avid hiker but has not done much running throughout his life. He does not have dreams of a podium; however, he wants to be able to finish the race without walking.
Process Goals:	Base: He will do three cardio workouts a week and focus on exercising at VT1 to develop aerobic endurance. Build: He will do four cardio workouts a week and will incorporate interval training to improve aerobic conditioning without a high volume of work (because of existing muscle imbalances). The phase will end with a week of hard workouts before the taper phase. Taper: He will use stationary cycling with one short run to prepare for the run. Recovery: He will focus on walking and stationary cycling to allow muscles to recover from the stress of completing the 10K.
Assessment Considerations:	The overhead squat assessment identified lower extremity postural distortion. His knees adduct and his feet over-pronate. As a result, foam rolling the tight muscles is recommended prior to running workouts, and one cardio workout a week will be on a stationary bike so he can work on aerobic capacity without increasing the risk of injury.

Annual Plan

MONTH	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase			Base			Build		taper	Recover			

Base Phase

He will do foam rolling or SMR for 45 seconds for each muscle on each leg: calves, adductors, and hip flexors. He will do static stretching for 30 seconds for each muscle on each leg: calves and hip flexors. He will walk for 5 minutes, gradually increasing the pace to a point where breathing becomes quicker.

Warm-Up:

He will do foam rolling or SMR for 45 seconds for each muscle on each leg: calves and hip flexors. He will do static stretching for 30 seconds for each muscle on each leg: calves and hip flexors. He will do dynamic stretching using forward lunges and lateral lunges for six reps in each leg in two sets. For the running workouts, he will walk for 5 minutes, gradually increasing the pace to a point where breathing becomes quicker. For the cycling workout, he will cycle at a steady pace for 5 to 7 minutes, gradually increasing resistance and speed.

Warm-Up:

He will do foam rolling or SMR for 45 seconds for each muscle on each leg: calves, hip flexors, adductors, and quadriceps. He will add foam rolling for lats and piriformis to reduce muscle tightness before the race. He will do static stretching for 30 seconds for each muscle on each leg: calves, hip flexors, adductors, and quadriceps.
