

Cardio Training Template

Client Name:	Nathan
Outcome Goal:	Nathan is going to be a sophomore in high school and wants to prepare for the upcoming junior varsity football season. He has been playing football for five years and played both linebacker and tight end on the team his freshman year, but he was not a starter. Nathan wants to focus on his conditioning so he can compete for a starting role this upcoming season.
Process Goals:	Base: Nathan will be following the school's strength training program in addition to doing three cardio-specific workouts. The focus of this phase will be on developing endurance to enhance aerobic capacity in order to improve his ability to recover quickly during high-intensity exercise. Two cardio workouts will focus on Stage 2 aerobic steady-state, and the other cardio workout will use anaerobic interval training in Stage 3 to improve his overall conditioning. Build: Nathan plays two positions, linebacker, and tight end, both of which require speed, agility, and quickness (SAQ); therefore, this phase will focus on three workouts a week, featuring high-intensity interval training (HIIT) using SAQ drills so he can improve his footwork while at the same time improving his overall conditioning and ability to quickly recover from explosive, anaerobic exercise. Taper: Nathan is going on a family vacation the first week of August before football practice starts on the second week. During the week of vacation, Nathan will do some low-intensity running and will otherwise focus on hiking and flexibility training so that his body can be well-rested for the start of the two-a-day practices. The team will do two weightlifting sessions per week and will have conditioning during practice to maintain fitness and work capacity throughout the course of the season. Recover: To maintain his conditioning while allowing his muscles to recover from the stresses of the season, Nathan will focus on indoor cycling, playing pick-up basketball, and swimming for a few weeks before starting his preparations and training for the next football season.
Assessment Considerations:	The overhead squat assessment showed an anterior tilt to the pelvis, and both arms dropped, which could indicate tight hip flexors and latissimus dorsi. As a student, he sits most of the day, so those muscles could be tight and should be stretched before a workout program.

Annual Plan

MONTH	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase	General fitness		Base			Build		Taper	Season			Recover

Base Phase

Foam roll calves and hip flexors and lasts for 30 to 45 seconds each. For static flexibility, stretch calves, hip flexors, quadriceps, hamstrings, and latissimus dorsi for 30 seconds each prior to starting the activity. For running workouts, start walking and gradually increase the pace to a slow, steady jog. For the indoor cycling workout, start pedaling at a slow pace and gradually increase the resistance and overall intensity.
