

Cardio Training Template

Client Name:	George
Outcome Goal:	He wants to compete for the Novice title in weight class, which is three 5-minute rounds.
Process Goals:	George will continue martial arts training with his instructor and sparring with other students four days a week. These workouts are in addition to that training. Base: Perform aerobic endurance one day a week using different equipment for different muscle groups. Two workouts of anaerobic threshold steady-state will increase his heart rate at VT2. One short high-intensity interval training (HIIT) workout will help improve overall conditioning. Build One workout of intervals at VT2 will improve the anaerobic threshold. Two HIIT workouts will improve anaerobic metabolism and the ability to recover from high-intensity exercise. One low-intensity, steady-state workout is for aerobic endurance and will promote recovery from other workouts. Taper: One HIIT workout will maintain anaerobic endurance. Two steady-state workouts and one long walk will maintain aerobic endurance. Recover: Low-intensity steady-state walking and indoor cycling will help reduce muscle soreness and promote optimal recovery.
Assessment Considerations:	The overhead squat assessment did not identify any specific postural distortions or muscle imbalances. He will do flexibility training as a warm-up using a foam roll for self-myofascial release and exercises for dynamic flexibility at the start of every workout.

Annual Plan

MONTH	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase		Base			Build		Taper	Recover	General fitness			

Base Phase

He will perform self-myofascial release using a foam roller prior to the start of each workout. The focus will be on calves, quadriceps, adductors, piriformis, hip flexors, and latissimus dorsi for 30 to 45 seconds for each muscle group, both right and left. He will start indoor cycling at a slow pace and gradually increase the speed during the first 5 to 8 minutes. He will ride an assault bike at a steady pace, gradually increasing the speed before starting the anaerobic intervals.

Warm-Up:

He will perform self-myofascial release using a foam roller prior to the start of each workout. The focus will be on calves, quadriceps, adductors, piriformis, hip flexors, and latissimus dorsi for 30 to 45 seconds for each muscle group, both right and left. He will use bodyweight exercises from the strength phase of balance training for dynamic flexibility prior to the rope and Tabata workouts. He will start indoor cycling at a slow pace and gradually increase the speed during the first 5 to 8 minutes. He will use an assault bike at a steady pace for 4 to 5 minutes before increasing anaerobic intervals.

Warm-Up:

Every day during taper, he will perform self-myofascial release using a foam roller for the calves, peroneals, hamstrings, quadriceps, adductors, piriformis, hip flexors, latissimus dorsi, and spinal erectors for 30 to 45 seconds for each muscle group, both right and left. He will also perform static flexibility for those muscle groups to ensure optimal length–tension relationships and recovery prior to the tournament. The warm-up for the running workout will be walking and gradually increasing pace over the course of 10 to 12 minutes. The warm-up for indoor cycling and the assault bike will be 4 to 6 minutes of gradually increasing intensity.
