

Cardio Training Template

Client Name:	George
Outcome Goal:	He will compete in his first MMA tournament. Each match against an opponent will consist of three 3-minute rounds, or until a submission occurs. To win his first match, he must identify areas to improve for future competitions.
Process Goals:	Base: He will be working with a martial arts coach three times per week to work on striking and grappling skills, and he will work out three times per week on his own to improve aerobic conditioning to be able to maintain a work rate during competition. Two workouts will focus on aerobic steady-state, while one workout will be anaerobic interval training. Build: He will continue working with a martial arts coach three times per week. Two workouts will focus on sparring to prepare for facing opponents. He will work out four times a week on his own, one time to focus on aerobic conditioning and three times for anaerobic high-intensity interval training to focus on the energy-specific needs of competing in MMA. Taper: Reducing training volume and intensity, he will continue running and the rowing machine to maintain endurance and focus on flexibility to ensure optimal preparation for competition. Recover: Low- to moderate-intensity exercise will increase circulation to remove metabolic by-products from muscles while promoting optimal tissue repair.
Assessment Considerations:	His martial arts background means that the client has good body awareness and control. He could not maintain his arms in a raised position during the overhead squat assessment, which could indicate tight latissimus dorsi and pectorals. The warm-up should reduce muscle tightness to allow for optimal joint range of motion during the exercise program.

Annual Plan

MONTH	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Phase			Base		Build		Taper	Recover				

Base Phase

He will perform self-myofascial release using a foam roller prior to the start of each workout. The focus will be on calves, quadriceps, adductors, piriformis, hip flexors, and latissimus dorsi for 30 to 45 seconds for each muscle group, both right and left. He will start running at a slow pace and gradually increase the speed during the first 5 to 8 minutes. He will do 3 to 5 minutes of rowing at a gradually increasing pace before starting the full workout. He will ride an assault bike at a steady pace, gradually increasing the speed before starting the anaerobic intervals.

Warm-Up:

He will perform self-myofascial release using a foam roller prior to the start of each workout. The focus will be on calves, quadriceps, adductors, piriformis, hip flexors, and latissimus dorsi for 30 to 45 seconds for each muscle group, both right and left. He will use bodyweight exercises from the stabilization phase of core training for dynamic flexibility prior to the rope and AMRAP workouts. He will start running at a slow pace and gradually increase the speed during the first 5 to 8 minutes.

Warm-Up:

Every day during taper, he will perform self-myofascial release using a foam roller for the: calves, peroneals, hamstrings, quadriceps, adductors, piriformis, hip flexors, latissimus dorsi, and spinal erector for 30 to 45 seconds for each muscle group, both right and left. He will also perform static flexibility for those muscle groups to ensure optimal length–tension relationships and recovery prior to the tournament. The warm-up for running workouts will be walking and gradually increasing the pace over the course of 10 to 12 minutes. The warm-up for the rowing machine will be 4 to 6 minutes of gradually increasing intensity.

Warm-Up:

After the tournament, he will perform self-myofascial release using a foam roller prior to the start of each workout for the muscles used in the tournament with a focus on the hamstrings, quadriceps, adductors, hip flexors, latissimus dorsi, and spinal erectors for 30 to 45 seconds for each muscle group, both right and left. He will also perform static flexibility for those muscle groups to ensure optimal length–tension relationships and recovery. The indoor cycling workout will start at a slow pace and gradually increase intensity for 4 to 6 minutes before starting the Stage 2 intervals.
