

CARBOHYDRATE DIGESTION AND ABSORPTION

1 MOUTH

In the mouth, chewing and an enzyme called salivary amylase begins the digestion process.

2 STOMACH

In the stomach, food mixes with gastric juices to continue the digestive process.

3 SMALL INTESTINE

In the small intestine, carbohydrates are broken down into monosaccharides and most nutrients are absorbed.

4 PORTAL VEIN/ LIVER / CIRCULATION

Monosaccharides enter the hepatic portal vein for transportation to the liver and target cells.
