

Part IV: Meal Prep Cooking Protein Prep Overview

Not all animal proteins are the same when comparing shelf life. Preferences for consuming certain meats on the day they're cooked versus reheating comes down to food safety, versatility, and taste. In this video, Chris talks about different animal proteins once cooked and how he ranks them against each other.

Chris's Key Takeaways

Consume Steak and ground on or within 3 days after being cooked.

Consume fish on or within 2 days after being cooked.

When cooking red meat, bacteria will live on the outside. Searing the surface to a temperature of at least 155°F will minimize foodborne illness risk.

When baked in the oven, cod and salmon are best cooked at temperatures between 350°F-450°F until the internal temperature reaches 145°F.

Chicken, regardless of cooking method, requires an internal temperature of 165°F.
