

Vegetables play a crucial role during the meal prepping process, providing the micronutrients needed otherwise nonexistent in restrictive diets. Chris discusses the different types of vegetables commonly used in prep and the advantages and disadvantages of each.

Chris's Key Takeaways

Gradually incorporate vegetables into your diet in quantity increments to avoid digestive issues.

Cycling between two to three vegetables in your meals helps promote variety while minimizing digestive issues.

Zucchini is highly versatile and can be prepared in many prep-friendly ways with little to no digestive issues.

Consider a dose-dependent threshold when consuming asparagus to minimize the possibilities of gas, bloating, and constipation.

Saving the consumption of higher-fiber vegetables for the last meals of the day can help with satiety.

Romaine lettuce and mixed greens are easily digestible and extremely low in calories but are often covered in calorically dense dressings.

Mushrooms are a great flavor enhancer and help with creating variety in the meals prepped.

Micronutrients help drive the macronutrients, leading to greater performance.

Accessibility and preference should be the driving factors when choosing fresh vs. frozen vegetables.

Cooked vegetables digest better compared to uncooked.
