

Sample plyometric exercises to optimize explosive upper and lower body power for MMA athletes:

Upper Body Plyometric Exercises

Medicine Ball Chest Pass: Develops explosive power of the chest, anterior deltoids, and triceps

Plyometric Push-Ups: Develops explosive power of the chest, anterior deltoids, and triceps

Lower Body Plyometric Exercises

Squat Jump: Develops vertical power of the lower body

Sample Plyometric Exercises

Horizontal (Broad) Jump: Develops horizontal power of the lower body

Lunge (Split Squat) Jumps: Develops vertical power of the lower body from a staggered stance

Lateral Hops (Ice Skaters): Develops lateral power, agility, and balance

Box Jumps: Develops vertical and horizontal explosive power of the lower body

Total-Body Plyometric Exercises	
Overhead Medicine Ball Throws: Develops explosive power of the lower body and shoulders	
Burpees (Squat Thrust): Develops explosive power of the chest, anterior deltoids, triceps, and lower body	
Depth Jump: Develops explosive power and eccentric control of the lower body	
Including these plyometric exercises in an MMA athlete's training program can help enhance their explosive power, agility, and overall performance in the ring or octagon. Moreover, using a contrast	

training protocol (resistance exercise immediately followed by a plyometric exercise) can further enhance physical performance. By performing a heavy resistance exercise followed immediately by a plyometric movement, one can potentially enhance the power output of the subsequent explosive activity. This training approach can be a strategic way to optimize both strength and power development in a single training session. As with any training, it is essential to progress gradually and ensure proper technique to prevent injuries and maximize the benefits of plyometrics.
