

Common Wrist Injuries in Bodybuilding

Injury Type	General Information	Symptoms	Relevant Risk Factors
Wrist Sprain/Sensitivity  <i>Adapted from Aksanaku/Shutterstock.com</i>	Occurs either insidiously or from a fall where the wrist is positioned in extension and excessive bodyweight is borne through the wrist joint leading to pain and functional impairment.	General or sharp pain in the posterior wrist with loaded movements when the wrist is positioned in extension.	Excessive exercise volume with the wrist positioned in extension (e.g., push-ups); limited wrist extension range of motion.
Carpal Tunnel Syndrome  <i>Adapted from Pepermprom/Shutterstock.com</i>	Occurs when the median nerve is excessively compressed passing through to the hand within the carpal tunnel leading to sensory and/or strength deficits in the hand (e.g., gripping).	Numbness, tingling, and/or loss of grip strength in the thumb, index, and middle finger; may be worse at night and affect sleeping.	Repetitive and/or sustained wrist flexion activities.
