

Warm-Up Sets

	One to Two Warm-Up Sets	Percentage Based Warm-Up (Number of Sets Predetermined)	Practical Approach, Autoregulated Components
Example	135 × 10 315 × 5 405 × 5 405 × 5 405 × 5	50% of the working load 200 pounds × 10 70% of the working load 285 × 5 90% of the working load 365 × 3 405 × 5 405 × 5 405 × 5	135 × 10 225 × 8 315 × 5 365 × 3 405 × 5 405 × 5 405 × 5
Notes	Not enough warm-up sets to properly acclimate and prepare the mind and body for the working loads. This can lead to decreased performance and increases the risk of injury.	The first set may be too heavy, which does not allow the athlete to properly warm-up and build their confidence through their acclimation sets. It also lacks practicality with loading the barbell.	This approach can be autoregulated and adjusted based on the individual, their strength level, and how they feel on that day. Some days, they may need more warm-up sets to prepare for their working sets.
