

Neuromuscular Training Continuum

Neural demand refers to the challenge an exercise places on the balance and stabilization of the kinetic chain. Integrated training progressively and systematically alters the base of support, center of gravity, and neural demand to improve neuromuscular efficiency. There are a vast quantity of progressions which fall along the neural continuum.

- 1 Always start an athlete with a simple exercise.

- 2 Create different progressions by manipulating one variable at a time. To begin, start with the first line and then continue by only manipulating one variable at a time.
