

Performance Nutrition and the Role of the Sport Performance Coach

Within Scope of Practice	Outside of Scope of Practice (Unless qualified in the applicable discipline)
Maintain a fitness log of the client's anthropometrics.	Order or interpret lab work.
Obtain a general diet history to review overall eating behavior and food choices and guide the client toward healthier food choices.	Provide a meal plan to the client.
Demonstrate food preparation methods.	Prescribe a therapeutic diet.
Review the importance of overall energy (calorie) balance and its effect on weight management.	Provide specific calorie recommendations or diagnose calorie-related conditions like Relative Energy Deficiency in Sport (REDs) or the female athlete triad.
Review factors that influence bodyweight, including social, lifestyle, and dietary habits.	Recommend supplements for weight gain or loss.
Review the actions of nutrients on the body.	Diagnose specific nutrient deficiencies.
Review the guidelines for recommended quantities of essential nutrients.	Recommend specific nutrient intake amounts.
Review how macronutrients impact performance and recovery.	Provide specific macronutrient recommendations.
Review the importance of hydration and the role of electrolytes.	Design a specific hydration protocol for the client.
Discuss pre-, intra-, and post-exercise nutrition for performance and recovery.	Design a specific nutrition plan for pre-, intra-, and post-exercise nutrition.
