

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Rest	Back Squat 3x8@75% 1RM	Bench Press 3x8@75% 1RM	Conditioning 3x300 yds (2-min. recovery)	Deadlift 3x8@75% RM	Narrow Grip Strict Press 3x8@75% 1RM	Conditioning 4x200yds (1-min. recovery) 6x50 yds (30-sec. recovery)
	Stiff Leg Deadlift 3x10@70% 1RM	Bent Over Row 3x8@75% 1RM		Front Squat 3x10@70% 1RM	Lat Pull-Down 3x8@75% 1RM	
	Belt Squat 3x8@80% 1RM	Swiss Bar Neutral Grip Bench Press 3x8@70% 1RM		Leg Press 3x8@80% 1RM	Wide Dumbbell Overhead Press 3x8@70% 1RM	
	Box Step-Up 2x8@70% 1RM	Neutral Grip Low-Pulley Row 3x8@70%		Barbell Lunges 2x8@70% 1RM	Chin-Ups 2x5@6RM 1x reps to failure	
	Nordic Curls 2x8	Cable Machine Chops/Lifts 4x10 (1 set per side per direction)		Nordic Curls 2x8	Cable Machine Chops/Lifts 4x10 (1 set per side per direction)	
	Dumbbell- Loaded Cossack Squat 2x8			Dumbbell- Loaded Lateral Box Step-Up 2x8		
Note: This is a sample week that includes an upper-/lower-body split routine and metabolic conditioning. Later in the off-season, there would likely be a greater emphasis on power (e.g., plyometrics), as the program transitions toward the pre-season. The exercise selections are based on total-body strength covering fundamental movements but can be adapted to fit the needs of the sport or the specific strengths/weaknesses of the athletes. The progression each week could be a combination of load and/or volume.						

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Rest	Power Clean 3x3@85% 1RM	Bench Press 3x5@85% 1RM	Conditioning 2x (8x20 yds—10 yds out and back) (15-sec. recovery)	Back Squat 3x5@85% RM	Narrow Grip Strict Press 3x5@85% 1RM	Conditioning 6x40 yds (25-sec. recovery) 2x(8x10 yds) (10-sec. recovery)
	Front Squat 3x6@80% 1RM	Bent Over Row 3x5@85% 1RM		Stiff-Leg Deadlift 3x6@80% 1RM	Lat Pull-Down 3x6@85% 1RM	
	Box Step-up 2x8@70% 1RM	Swiss Bar Neutral Grip Bench Press 2x6@80% 1RM		Dumbbell-Load Plyometric Lunges 2x8 1RM	Wide Dumbbell Overhead Press 2x8@70% 1RM	
	Nordic Curls 2x8	Neutral Grip Low-Pulley Row 2x6@80%		Dumbbell- Loaded Lateral Box Step-Up 2x8	Chin-Ups 2x5@6RM	
Note: This is a sample week that includes an upper-/lower-body split routine and anaerobic conditioning. The strength training begins to incorporate a much greater emphasis on power. Later in the pre-season, there would likely be an even greater shift toward power (e.g., added accessories like hex bar jump squats, landmine jerks, etc.) as the program transitions toward the in-season. The exercise selections are based on total-body strength covering fundamental movements but can be adapted to fit the needs of the sport or the specific strengths/weaknesses of the athletes. There is a slight reduction in volume to accommodate sport practices, likely occurring most days of the week.						

In-Season Training Program

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Rest	Power Clean 3x3@90% 1RM	Small-Sided Games 4x4-min. (3-min. active recovery between games)	Front Squat 3x3@85% 1RM 3x3 Vertical Jump (performed as superset)	3x20-yd Flying Sprints (60-sec. recovery)	Hex Bar Jump Squat 3x3@85% 1RM	Game Day
	Back Squat 3x5@85% 1RM		Barbell Hip Thrust 3x3@85% 1RM 3x3 Broad Jump (performed as superset)	3x	Vertical or Broad Jump 3x3 Max Effort	
	Bench Press 3x5@85% 1RM		Single-Arm Dumbbell Push-Press 3x5		Zig-Zag Hops 2x10 yds	
	Bent Over Row 3x5@85% 1RM		Renegade Rows 3x5			
	Note: This is a sample week that includes two total-body workouts and a lower-body pre-game potentiation workout. Maintaining strength is important but translating that strength into power and athleticism is even more important during the in-season. The exercise selections are less varied and focus on core exercises with the most positive transfer (dependent on the sport). The metabolic conditioning will be more of a maintenance stimulus from games and other practice drills. Small-sided games are an efficient method of offering an opportunity for athletes to be metabolically challenged while still implementing technical and tactical aspects of the sport. During in-season training, the previously trained strength and power should be translated into speed work, which requires more recovery than metabolic conditioning to promote neurological adaptations.
