

When designing an intervention that can cause change in eating behavior, consider the following process (Atkins & Michie, 2015):

1. Select a behavior - Generate a list of all the potential behaviors that could be changed and for each ask:

1. What difference will changing this behavior make?
2. How likely is it that this behavior can be changed?
3. Could changing this behavior positively or negatively influence other behaviors?

2. Specify the behavior targeted for change - For each behavior, clearly state:

1. What does the person need to do differently to achieve the desired change?
 2. When will they do it?
 3. Where will they do it?
 4. How often will they do it?
 5. With whom will they do it?

3. Identify intervention options

1. What interventions are available?
 2. How does this intervention cause benefit?

4. Identify actions to be implemented

1. What actions does the fitness professional need to take (and when)?
 2. What actions does the client need to take (and when)?
